

Course on Computer Concepts

Detailed Chapter Notes & Worked Examples - Volume 2

This pack develops practical understanding through explanations, worked examples, lab tasks and review questions. Complete the matching Foundation Pack first.

Chapter	Topic
1	Files and operating system
2	Word, spreadsheet and slides
3	Internet and email
4	Digital safety

Chapter 1: Files and operating system

Concept notes

The operating system manages hardware, applications, users and files. Organize work with meaningful folders, file extensions and backups. Deleting a shortcut does not delete the original file.

Worked example

Create Documents/MCI/CCC/Practice and save Letter-v1.docx, Letter-v2.docx and Letter-final.pdf.

Lab assignment

Create the folder structure, compress it and restore one deleted practice copy.

Review questions

1. What is a file extension?
2. Difference between copy and shortcut?
3. Why keep two backups?

Evidence to submit: source file or working output, screenshot/PDF, and a 100-word explanation of decisions and checks.

Chapter 2: Word, spreadsheet and slides

Concept notes

Word handles long formatted documents; spreadsheets calculate and analyse structured data; slides support visual presentation. Choose the tool by required output.

Worked example

Prepare a notice in Word, calculate monthly expenses in a sheet, then make a three-slide summary.

Lab assignment

Produce all three using consistent title, date and institute name.

Review questions

1. Which tool is best for calculations?
2. What is a cell address?
3. Why avoid text-heavy slides?

Evidence to submit: source file or working output, screenshot/PDF, and a 100-word explanation of decisions and checks.

Chapter 3: Internet and email

Concept notes

Search with specific terms, inspect source and date, and use secure HTTPS sites. Email needs a clear subject, concise body and correct attachment.

Worked example

Search an official scheme, save its official PDF and email a short summary to a practice address.

Lab assignment

Draft the email without sending; attach the correctly named PDF.

Review questions

1. What indicates HTTPS?
2. Why check publication date?
3. What belongs in subject line?

Evidence to submit: source file or working output, screenshot/PDF, and a 100-word explanation of decisions and checks.

Chapter 4: Digital safety

Concept notes

Use unique passwords, MFA, updates and backups. OTP, PIN and recovery codes are secrets. Phishing creates urgency and imitates trusted organizations.

Worked example

A message demands KYC within 10 minutes through a shortened link. Verify via the official app or number, not the message link.

Lab assignment

Create a ten-point family cyber-safety checklist.

Review questions

1. Should support staff ask for OTP?
2. How verify a suspicious message?
3. What does MFA add?

Evidence to submit: source file or working output, screenshot/PDF, and a 100-word explanation of decisions and checks.

Final Applied Assignment

Create one original project that combines all four chapters of Course on Computer Concepts. Use realistic but non-sensitive sample data. Submit planning notes, source files, final output, test evidence and a one-page reflection.

Assessment rubric

Area	Marks
Concept accuracy	25
Working practical output	30
Validation and testing	20
File organisation and presentation	15
Original explanation	10

Student declaration

I confirm that the submitted work is my own practice. I have not included passwords, OTPs, identity documents or confidential student records.
